GAME – CARIOGENIC FOOD

Some studies reveal correlations between the presence of caries and the nutritional habits practiced by the child. Therefore, we can consider the feeding behavior as a determining factor for the prevention of dental caries.

(Gustafsson *et al.*, 1955)

Playing is part of the natural development of the child, being that playful activity is constituted as a fun way to learn important concepts and skills.

(Garvey, 1977)

DENTIST-PATIENT RELATIONSHIP

Medicine has historically been centered on the figure of the doctor, but the patient has been increasingly incorporating the role of the patient (patient-centered perspective)

(Laine & Davidoff, 1996)

EMPATHY

**Greater
relational link**

Avoid failures at the
level of communication

Establishment of an
EMPATHIC relationship

In this case study the dentist grants total child protagonism, task to which interpersonal and communicative skills are necessary acquired in the training of undergraduate dentist, restoring autonomy to the sick person

CONCLUSION

The first contact between the dentist and the patient is key in establishing a future relationship. What seems to influence more this contact is reading non-verbal language of the patient's face.

(Silva, 2008)

The figure of the dentist as a reader of the patient's facial expressions in the setting of dental service.

CONCLUSION

The application of ludic instruments with children in the odontopediatric consult constitutes itself as an asset under the health education thematic, promoting a more patient-centered perspective as well as its active and participative role in the therapeutic setting.
